

TCC-8000 RL TCC-8000 RS

Bring your fleet up to speed...

Upgrade your roller bearings to constant contact side bearings.

Miner's constant contact side bearings retrofit kits are designed to replace the older style double and single roller side bearings in existing Stucki 688-B and 656-C housings.

Miner's retrofit kits utilize metal-to-metal contact assuring superior truck rotational energy for optimal truck hunting control. In addition, Miner's exclusive TecnPak® spring provides maximum vertical energy absorption for car body roll control. Its flat vertical force-travel characteristics allow greater flexibility in setup height, plus improved curve negotiation on uneven track.

Constant Contact Side Bearing Retrofit Kits

TCC-8000 RL

TCC-8000 RS

Designed to fit most 70 and 100-ton equipment, the TCC-8000 RL replaces the double side roller bearings in existing Stucki 688-B housing, while the TCC-8000 RS retrofit kit replaces the single roller side bearing in Stucki 656-C housings.

Each kit consists of two metal oversolid stops, two shims, and a metal top cap attached to a TecsPak® block. Simply make sure the setup height is okay, raise the car, remove the roller(s), and install the kit parts. It's that simple.

For more information, contact your Miner Representative.

Over 100,000 TCC-8000 RL/RS units are currently in service.
